

# Recent T2K Neutrino Oscillation Results

**Artur Sztuc**

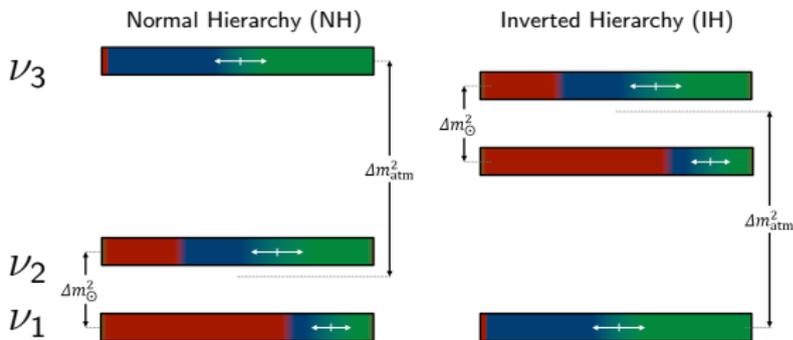

a.sztuc@ucl.ac.uk

On behalf of the T2K collaboration

UCL Seminar

1. Neutrino mixing
2. T2K experimental setup
3. T2K Data and model
4. Oscillation analysis results
5. Future prospects

- Flavour eigenstates;  $\nu_e$ ,  $\nu_\mu$  and  $\nu_\tau$  (interact)
- Mass eigenstates;  $\nu_1$ ,  $\nu_2$  and  $\nu_3$  (propagate)

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \underbrace{\begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix}}_{\text{atmospheric, beam}} \underbrace{\begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta_{\text{CP}}} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta_{\text{CP}}} & 0 & c_{13} \end{pmatrix}}_{\text{reactor, beam}} \underbrace{\begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}}_{\text{solar, reactor}} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

$$\begin{aligned}
 s_{ij} &= \sin \theta_{ij} \\
 c_{ij} &= \cos \theta_{ij}
 \end{aligned}$$

# The T2K experiment

T2K

UCL

Super-Kamiokande  
(ICRR, Univ. Tokyo)

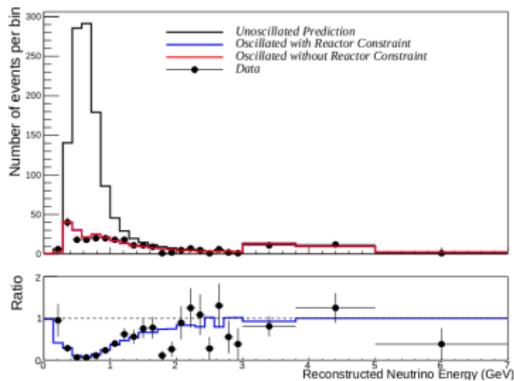

J-PARC Main Ring  
(KEK-JAEA, Tokai)

- Around 500 people from 68 institutions, 12 countries
- $\sim 0.6$  GeV narrow beam from J-PARC ( $\nu$  and  $\bar{\nu}$  mode)
- Near detector; ND280, 280 m from beam target, measures unoscillated spectrum
- Far detector; Super-Kamiokande, 295 km from the  $\nu$  source, measures oscillated spectrum

## $\nu_\mu$ disappearance

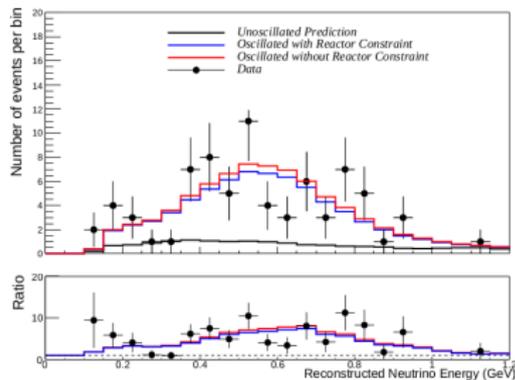

Location of the dip:  $|\Delta m_{32}^2|$

(does not depend on the sign)

Depth of the dip:  $\sin^2(\theta_{23})$

Difficult to separate  $\theta_{23} > 45$  and  $\theta_{23} < 45$

## $\nu_e$ appearance

Magnitude of the peak;

$\sin^2(\theta_{23})$ ,  $\sin^2(\theta_{13})$ ,  $\delta_{CP}$

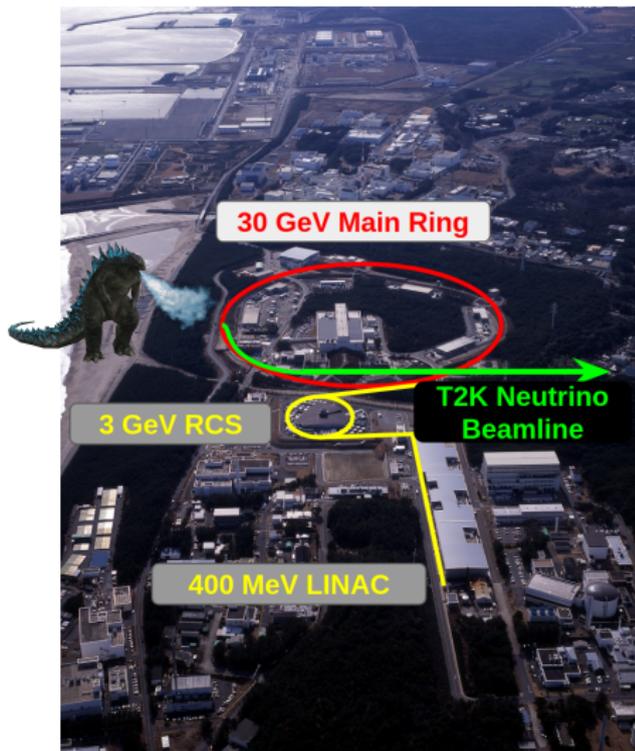

Small dependence on the sign of  $\Delta m_{32}^2$

Channel for CP violation detection

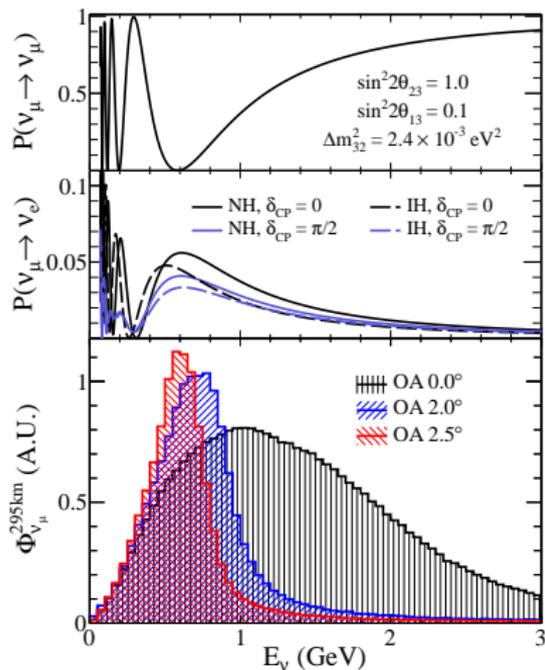

First-order sensitivity:  $|\Delta m_{32}^2|$ ,  $\sin^2 \theta_{23}$ ,  $\sin^2 \theta_{13}$

Second-order sensitivity: sign of  $\Delta m_{32}^2$ ,  $\sin^2 \theta_{23}$  octant,  $\delta_{CP}$

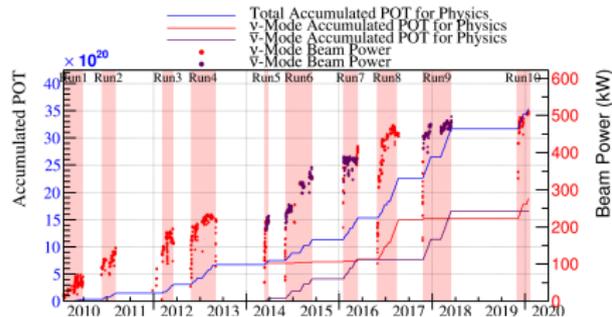

- The Main Ring shared between T2K and other experiments
- Fast extraction from the main ring with pulse every 2.5 s
- Plans to upgrade the power supply allowing 1.3 s pulse

# The T2K neutrino beam

Off-axis beam angle tuned for maximal  $\nu_\mu$  disappearance

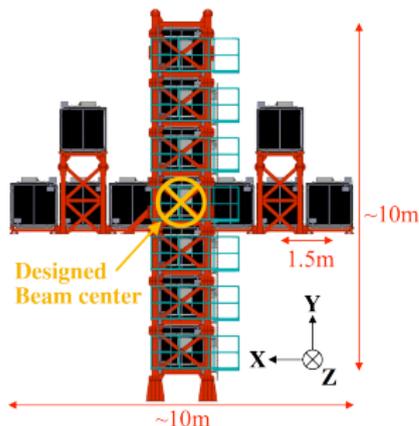

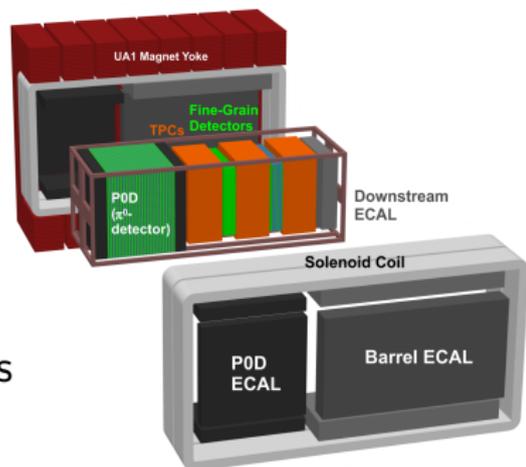

The latest result includes combined run 1–10 data

- $\nu_\mu$ :  $1.97 \times 10^{21}$  POT
  - $\bar{\nu}_\mu$ :  $1.65 \times 10^{21}$  POT
- (POT; Protons on target)

Beam operating over 500kW for the first time

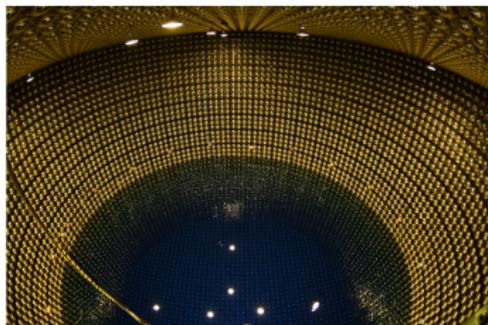

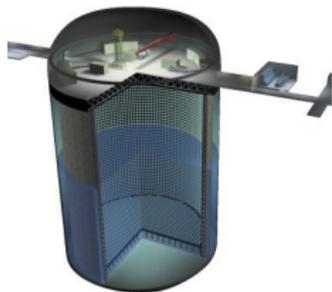

## ND280

- Off-axis, 280 m from beam target
- Measures unoscillated  $\nu$  spectrum
- Neutrino cross-section measurements

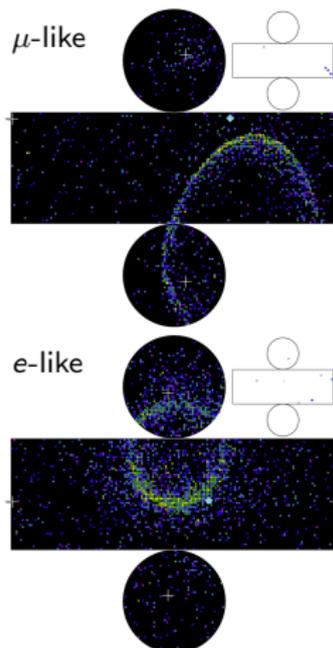

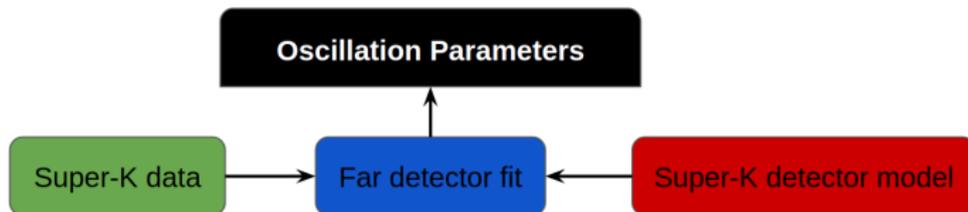

## INGRID

- On-axis, 280 m from beam target
- Measures beam direction and stability
- Also contributes to cross-sections
- Different flux spectrum

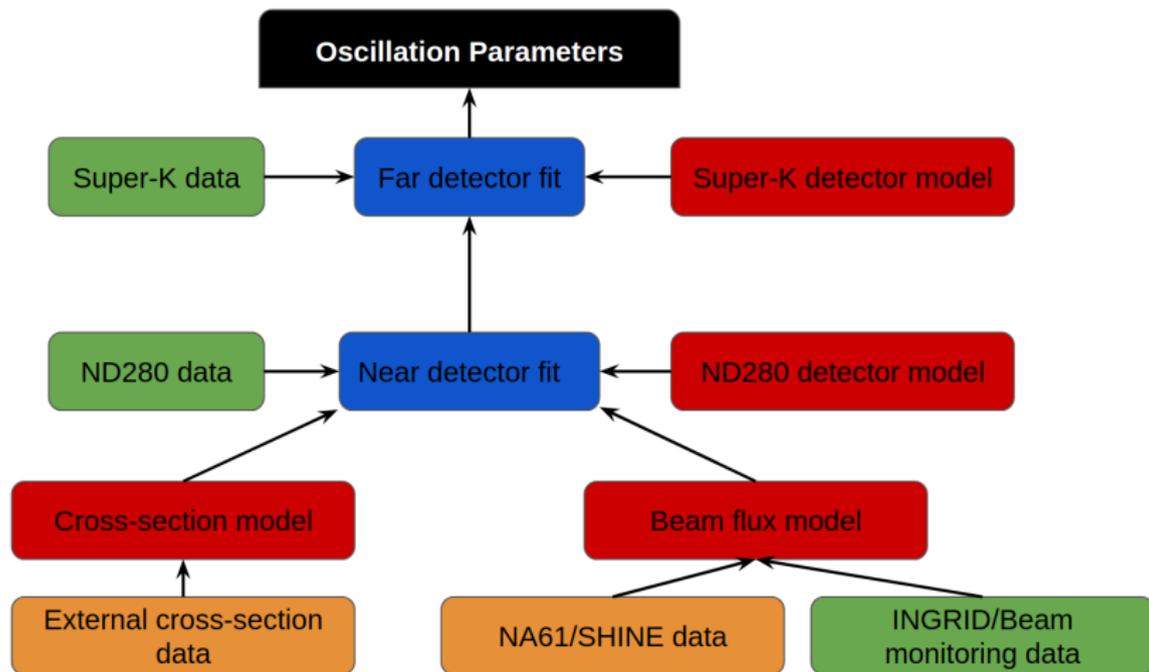

- 1000 m overburden
- 50 kton of water, 22.5 kton fiducial
- 11,000 PMTs in Inner Detector
  - 40% photo-coverage
- 2,000 PMTs in Outer Detector
  - Cosmic veto/outgoing particles

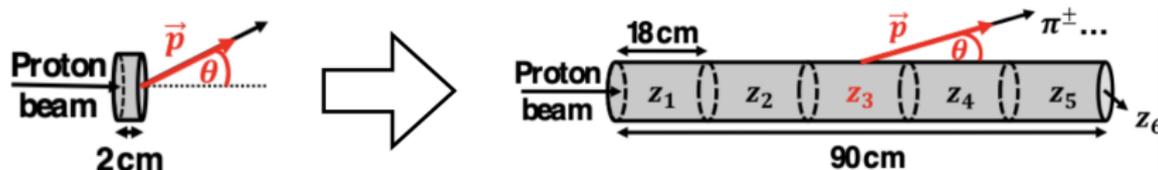

- Constraining the T2K model with Super-K data to extract oscillation parameters
- Super-K does not have enough statistics to constrain the cross-section and flux systematics well

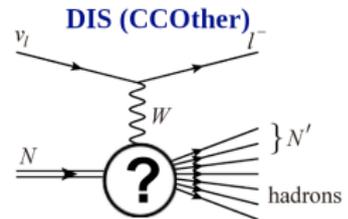

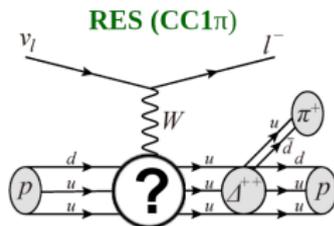

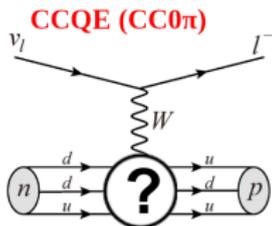

- The proton interactions on target simulated with FLUKA
- Simulation reweighted to NA61/SHINE data
- Update: thin graphite target replaced with T2K replica

- Flux uncertainties reduced from  $\sim 8\%$  to  $\sim 5\%$

- Three dominant scattering modes at T2K: **CCQE**, **RES** and **DIS**
- Moved from Relativistic Fermi Gas +RPA (2018) to a tuned Benhar spectral function
- Removal energy treated as a shift in lepton momentum, tuned to electron scattering data
- Correlated pion FSI uncertainties between ND and FD detectors
- Improved DIS treatment

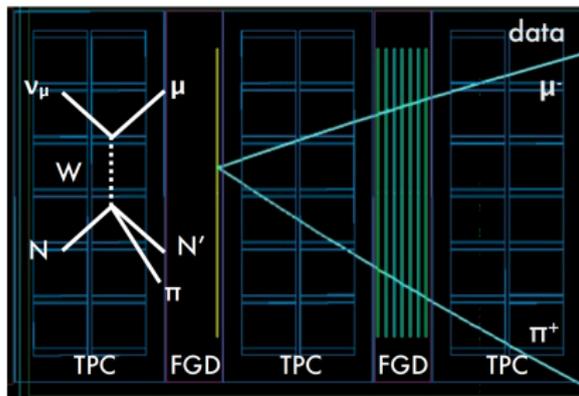

ND280 data constrains the neutrino flux and cross-section systematics at Super-K

Data samples for two FGD targets (CH and H<sub>2</sub>O);

- 3×2 samples for  $\nu$  beam mode
  - $\nu_{\mu}CC0\pi$  (primary in the analysis)
  - $\nu_{\mu}CC1\pi$  (shown on right)
  - CCOther
- 4×2 samples for  $\bar{\nu}$  beam mode
  - $\bar{\nu}_{\mu}CC1Track$
  - $\bar{\nu}_{\mu}CCNTrack$
  - $\nu_{\mu}CC1Track$
  - $\nu_{\mu}CCNTrack$

H<sub>2</sub>O samples constrain water interactions at Super-K

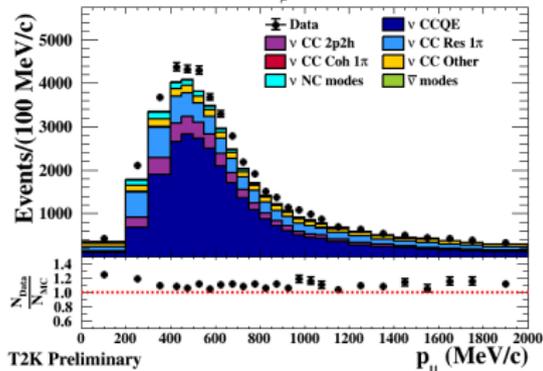

Data are binned in outgoing  $\mu$  momentum and angle

Two Fine Grid Detectors (FGD), event display shows FGD1 producing  $\mu^+$  and  $\pi^-$

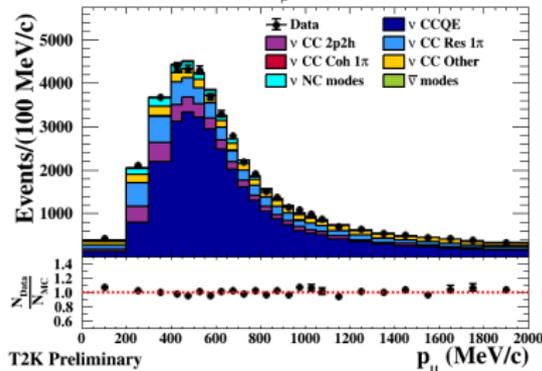

Prefit  $\text{CC}0\pi$

FGD1  $\nu_\mu \text{CC}0\pi$

Postfit  $\text{CC}0\pi$

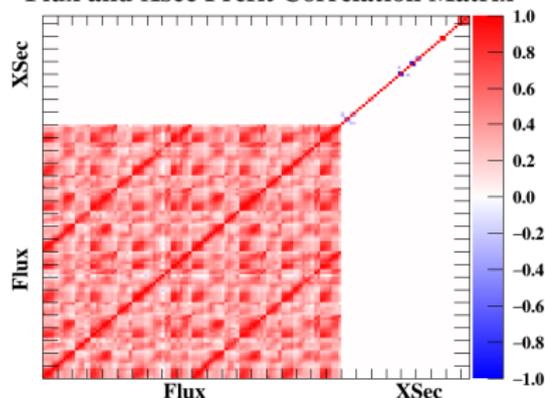

FGD1  $\nu_\mu \text{CC}0\pi$

- The prediction agrees much better with the data after the ND280 fit (p-value of 74%)
- This is true for all the data samples

Before ND fit

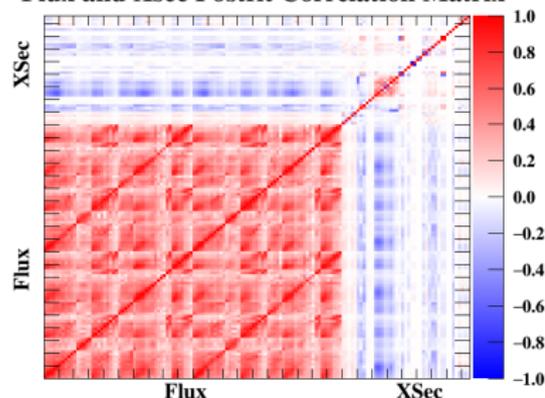

Flux and Xsec Prefit Correlation Matrix

T2K Preliminary

After ND fit

Flux and Xsec Postfit Correlation Matrix

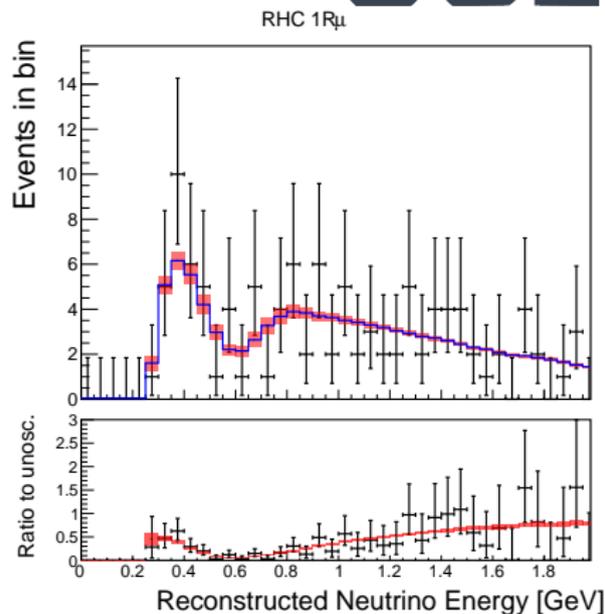

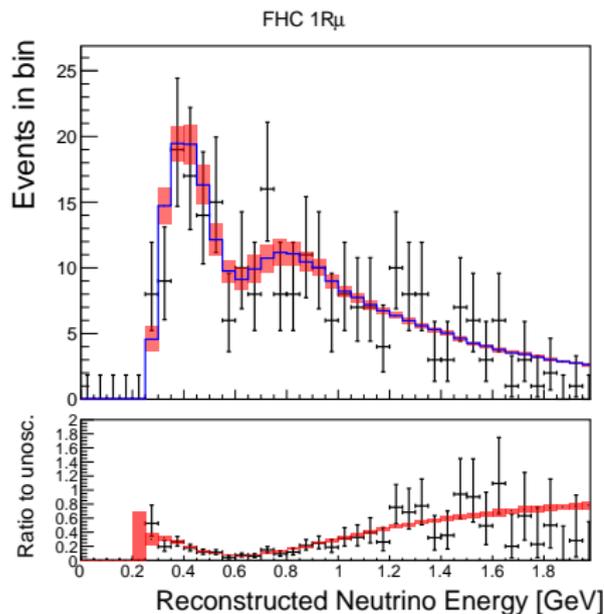

T2K Preliminary

- By constraining the predicted number of events, the ND fit introduces anti-correlations between cross-section and flux systematics

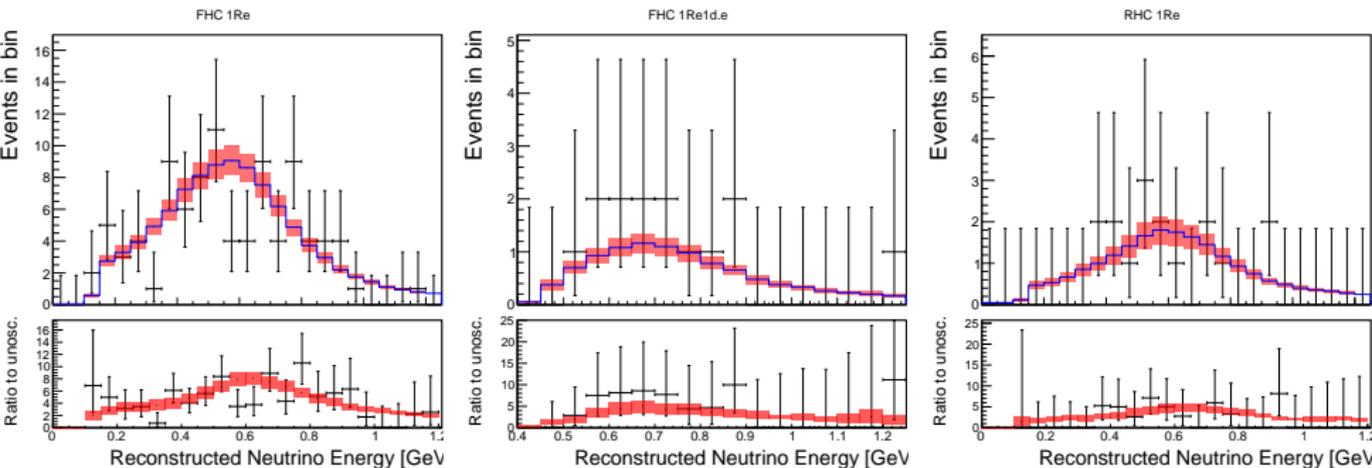

Super-K event rates systematic errors

Super-K sample	Without ND280	With ND280
$\nu$ -beam 1-Ring- $\mu$	11.1 %	3.0%
$\nu$ -beam 1-Ring-e	13.0%	4.7%
$\bar{\nu}$ -beam 1-Ring- $\mu$	11.3%	4.0%
$\bar{\nu}$ -beam 1-Ring-e	12.1%	5.9%

- The effect of the ND fit on the SK samples is large
- Systematic errors on Super-K event rates reduced from  $\sim 13\%$  to  $\sim 4\%$

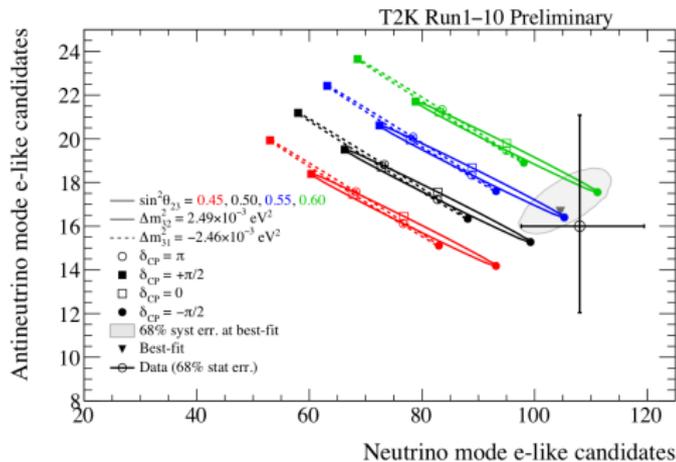

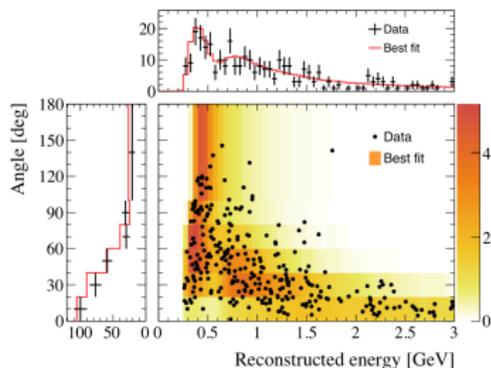

- Two  $\mu$ -like ring samples at Super-K
- One in  $\nu$ -beam mode and one for  $\bar{\nu}$ -beam mode
- Systematic uncertainty shown in red

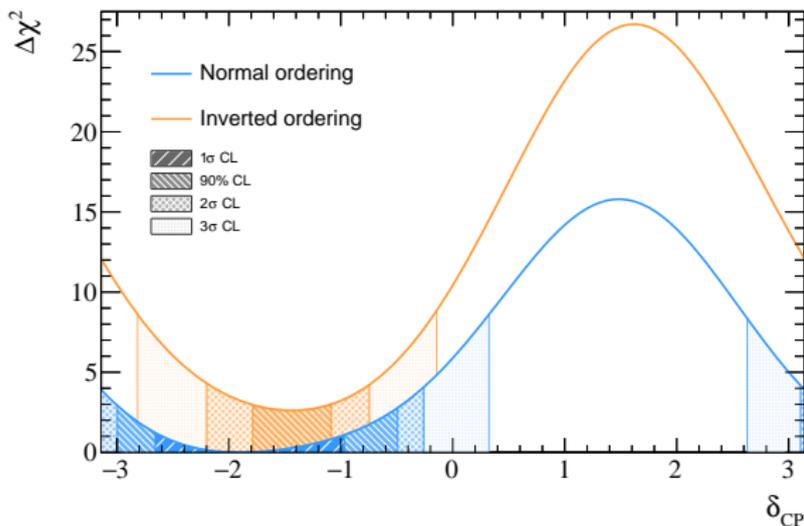

- Three  $e$ -like ring samples at Super-K
- One for each beam mode ( $\nu$ ,  $\bar{\nu}$ ), and one targeting  $CC1\pi$  events with Michel electron
- Systematic uncertainty shown in red

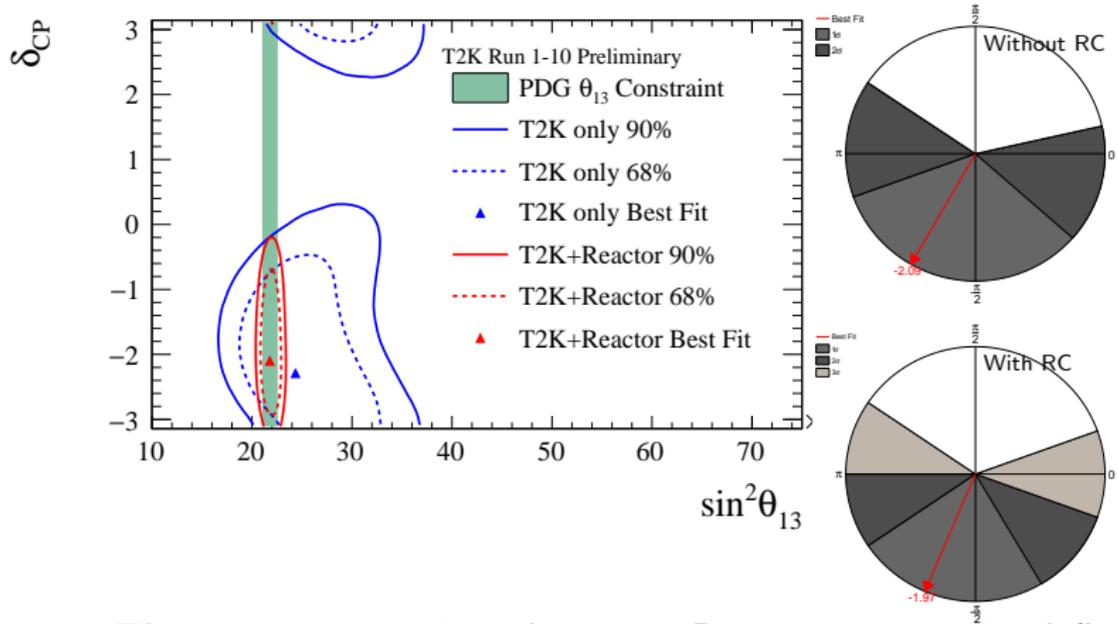

## $\nu$ -beam 1-Ring-e

	$\delta_{CP} = -\pi/2$	$\delta_{CP} = 0$	$\delta_{CP} = \pi/2$	$\delta_{CP} = \pi$	Data
FHC 1R $\mu$	346.61	345.90	346.57	347.38	318
RHC 1R $\mu$	135.80	135.45	135.81	136.19	137
FHC 1Re	96.55	81.59	66.89	81.85	94
RHC 1Re	16.56	18.81	20.75	18.49	16
FHC 1R $\nu_e$ CC1 $\pi^+$	9.30	8.10	6.59	7.79	14

- T2K rejects  $\sim 35\%$  area of  $\delta_{CP}$  values at  $3\sigma$
- Preference for the CP-violating values of  $\delta_{CP}$
- CP-conserving values excluded at 90% CL, but not quite at  $2\sigma$

- There are no tensions between Reactor-constrained fits and T2K-data-only
- T2K-only results for  $\sin^2 \theta_{13}$  agree well with PDG 2019

	$\sin^2 \theta_{23} < 0.5$	$\sin^2 \theta_{23} > 0.5$	Line total
Normal ordering	0.19	0.65	0.83
Inverted ordering	0.03	0.14	0.17
Column total	0.21	0.79	1.00

- Normal ordering and higher octant of  $\sin^2 \theta_{23}$  preferred
- Sensitivity to the  $\sin^2 \theta_{23}$  enhanced with the reactor constraint on  $\sin^2 \theta_{13}$

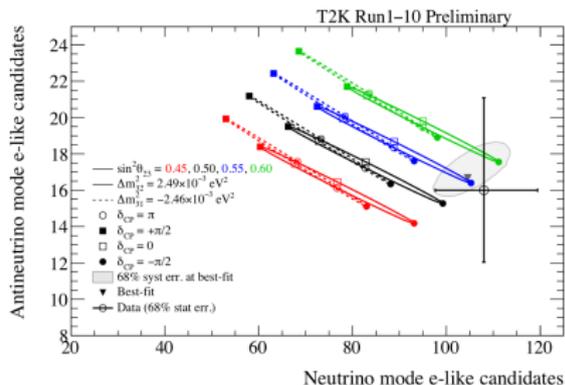

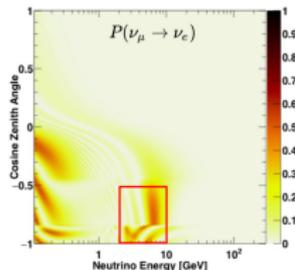

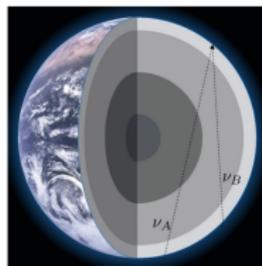

# Future prospects

- Both experiments operate at different  $\nu$  energies and oscillation baselines, with different systematic uncertainties
- Joint fit will help breaking degeneracies and maximising the impact of data

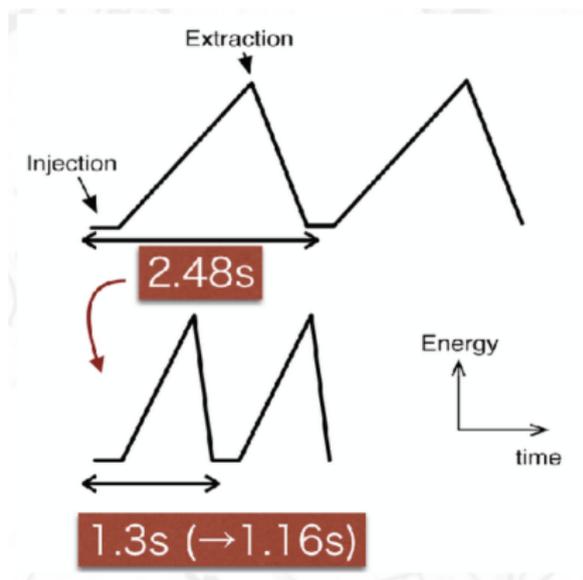

# T2K-SuperK joined fits

- Also operate at very different energies and “baselines”
- Atmospheric samples will help constraining the Super-K detector uncertainties and contribute to  $\delta_{CP}$  and the mass ordering

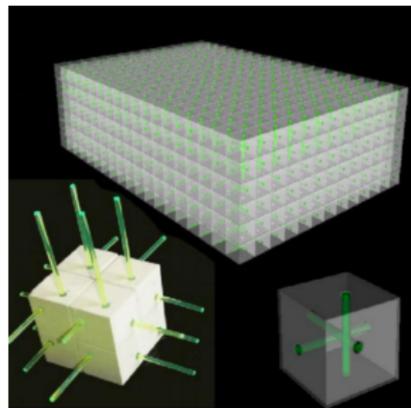

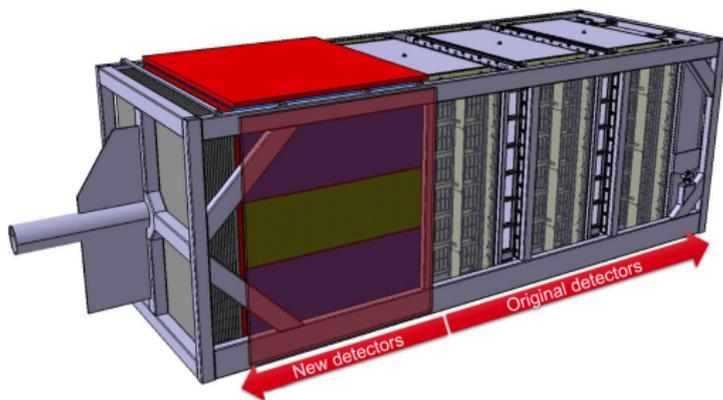

# Beam upgrade

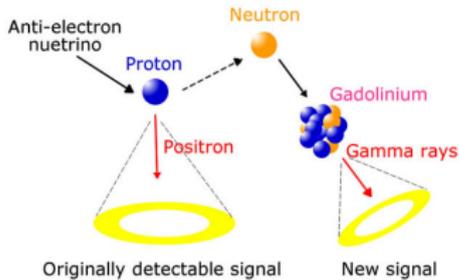

- Increase from 515kW in 2020, through 800kW in 2023 to over 1MW by 2027
- The main ring power supply upgrade completed
- Reduce the beam cycle from 2.48s to 1.3s (down to 1.16s)

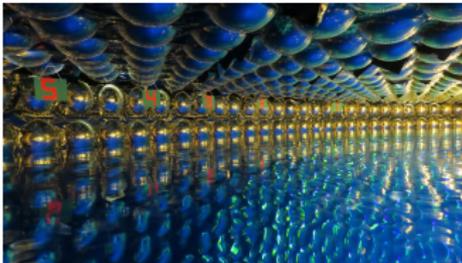

# Near detector upgrade

- To be upgraded by  $\sim 2022$  after a decade of operation
- New TPC with a higher angular coverage and better point resolution
- 3D SuperFGD made of 2M cubes
- Better hadron detection and more similar phase-space coverage to SuperK

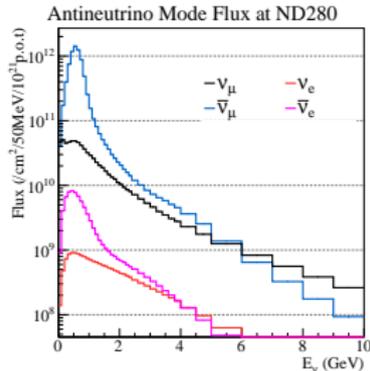

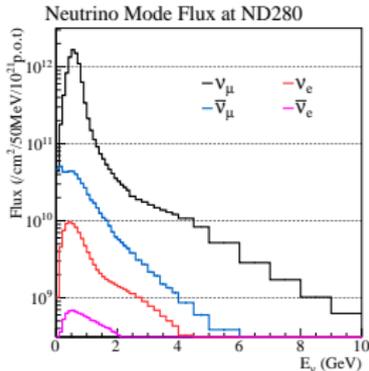

- 2018–2019 refurbishment to allow Gd doping
- Low-energy  $\bar{\nu}_e$  detection via neutron capture

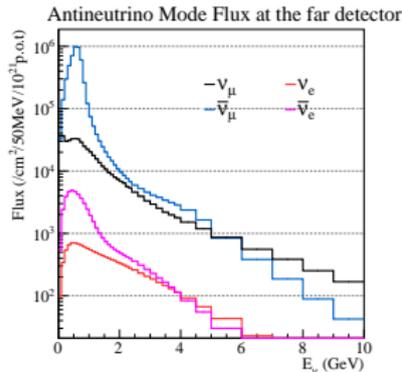

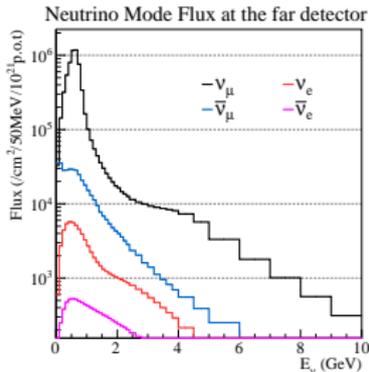

- CP-violating values of  $\delta_{CP}$  preferred, with 35% of the CP-conserving values rejected at  $3\sigma$  level
- Data prefers **Normal Hierarchy** ( $\sim 83\%$ )
- Preference for the **upper octant** of  $\sin^2 \theta_{23}$  ( $\sim 79\%$ )
- Many future upgrades planned:
  - Beam to each 1 MW by 2027
  - ND upgrades
  - Joint fits with Super-Kamiokande and NOvA
  - Super-Kamiokande with Gadollinium

# BACKUPS

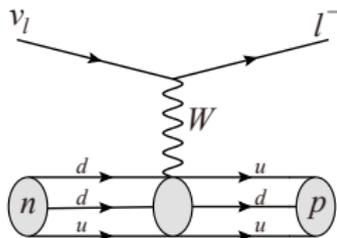

Beam flux composition at ND280

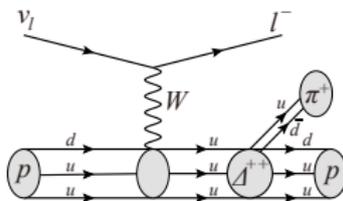

Beam flux composition at Super-K

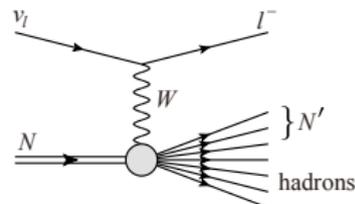

Charged Current Quasi Elastic (CCQE)

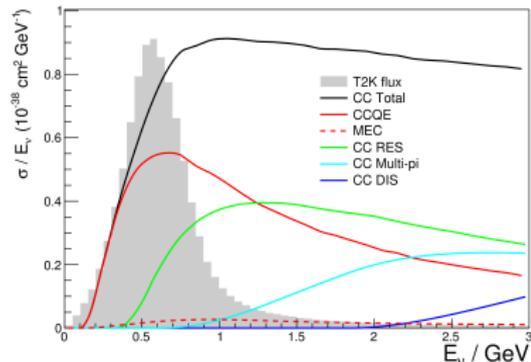

Charged Current Resonant Pion (CCRES)

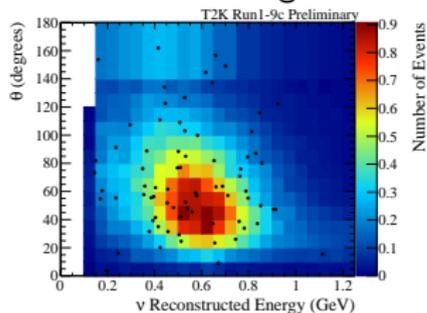

Charged Current Deep Inelastic Scattering (CCDIS)

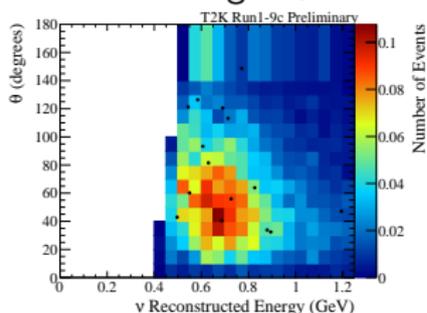

- CCQE dominant interaction mode for T2K
- Interactions with nucleon inside a nucleus
  - Nuclear model dependent
  - Nuclear effects can bias interaction mode and energy reconstruction
- Interaction and Nuclear models tuned to external data

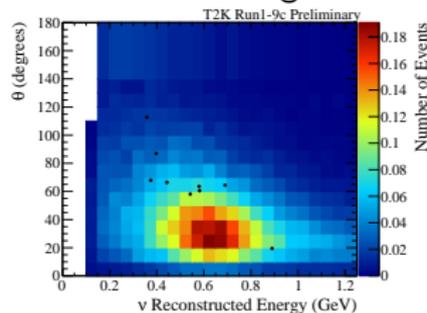

### $\nu$ -beam 1-Ring-e

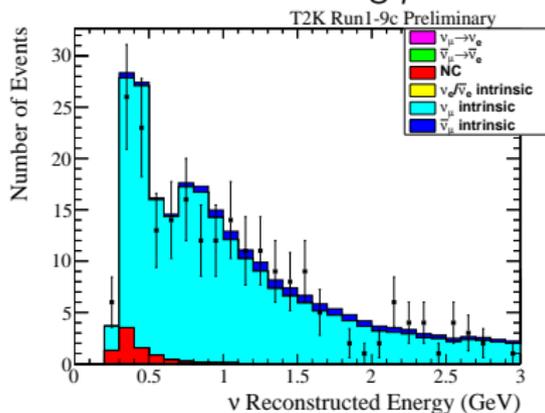

### $\nu$ -beam 1-Ring-e + $\pi^+$

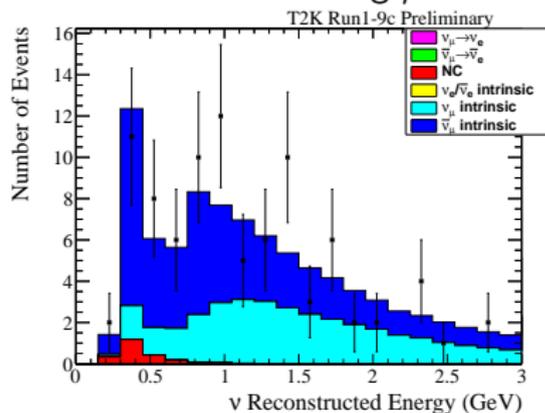

### $\bar{\nu}$ -beam 1-Ring-e

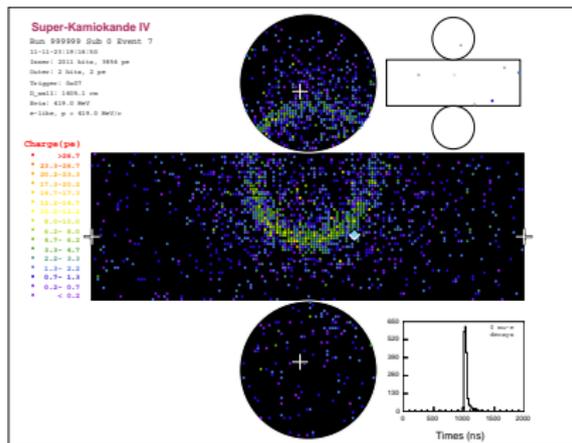

### $\nu$ -beam 1-Ring- $\mu$

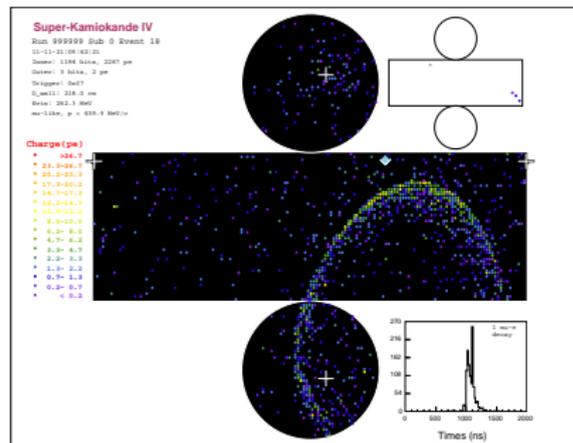

### $\bar{\nu}$ -beam 1-Ring- $\mu$

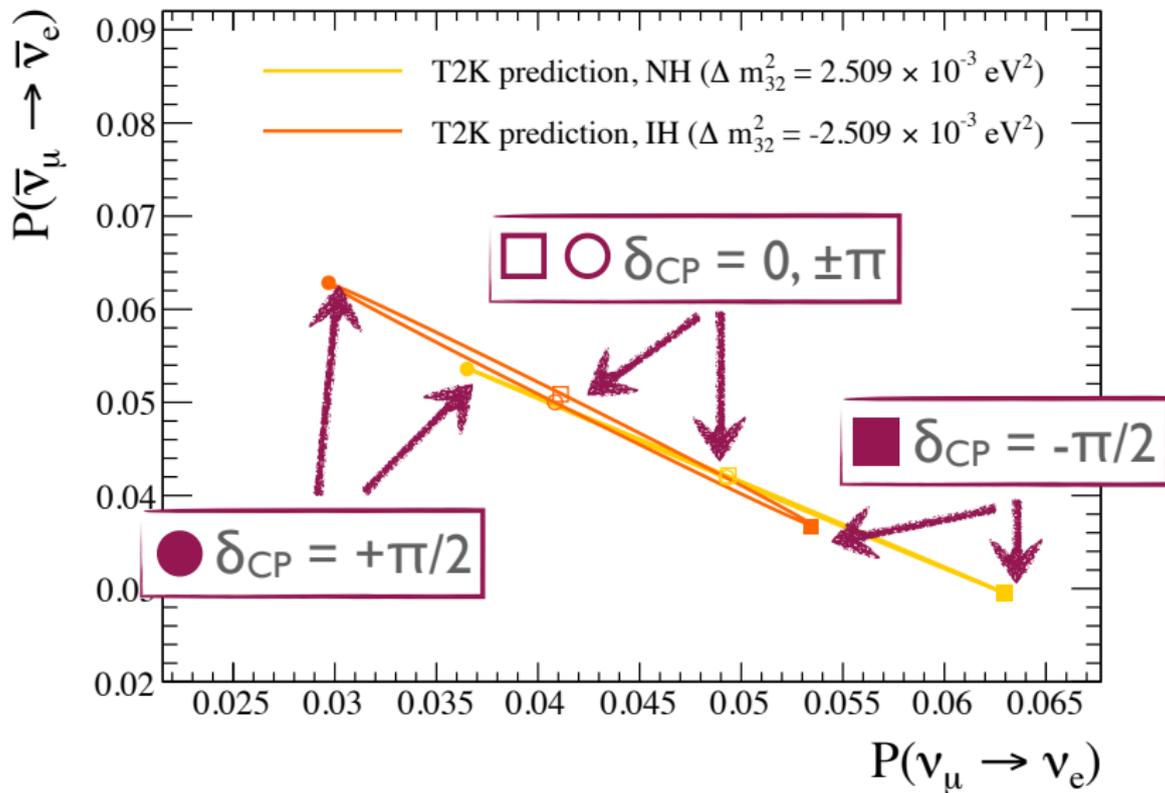

## e-like event

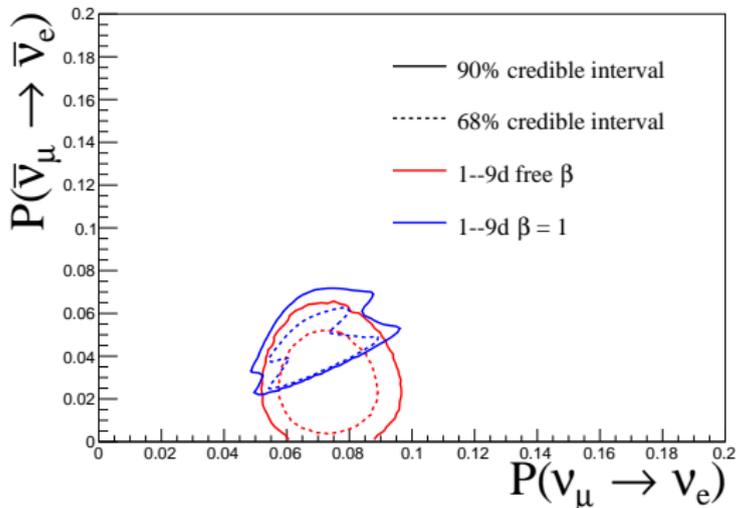

## $\mu$ -like event

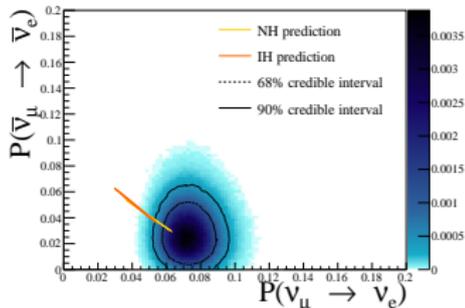

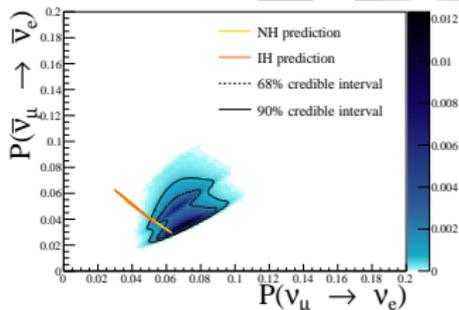

# Bi-probability plots: intro

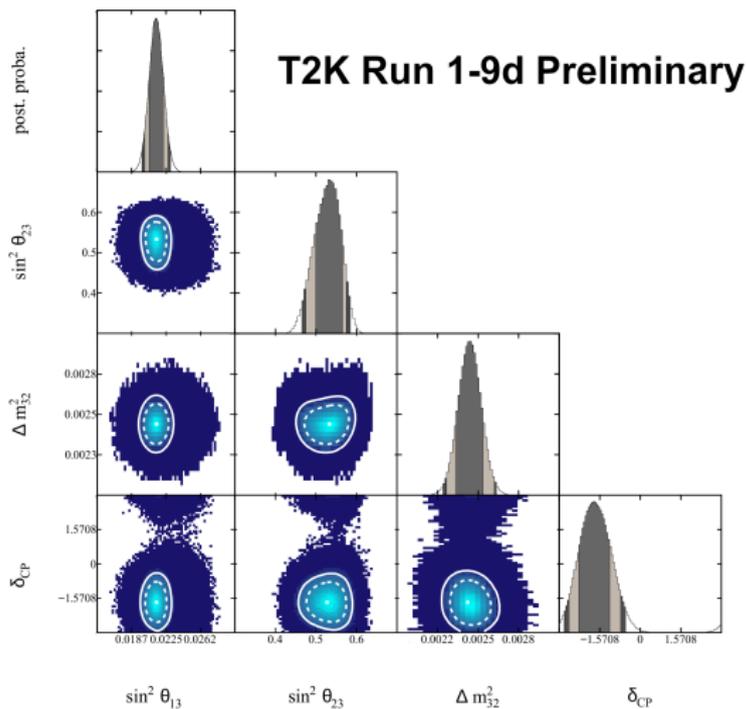

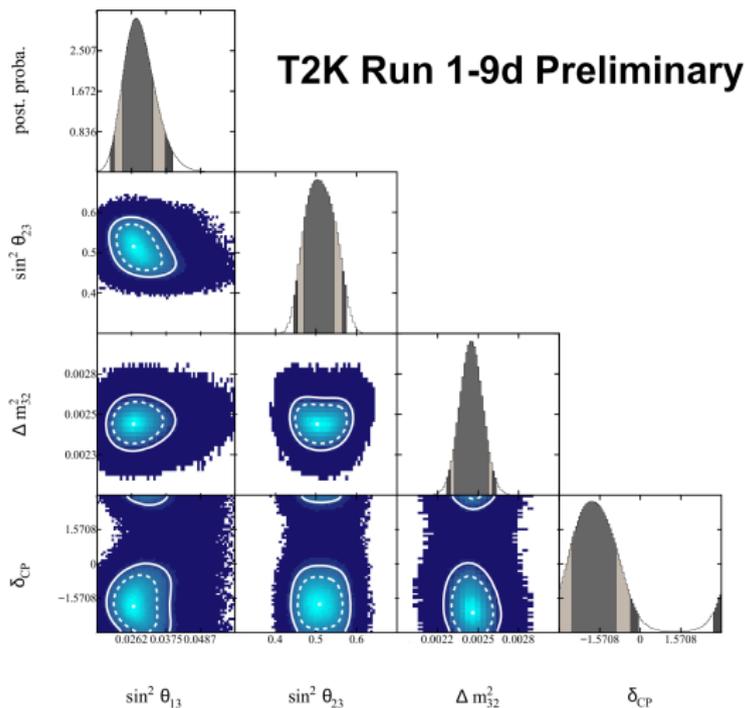

# Bi-probability plots

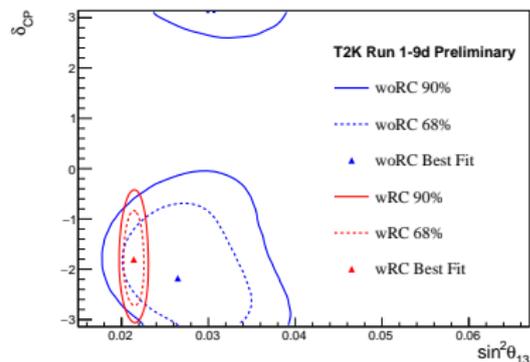

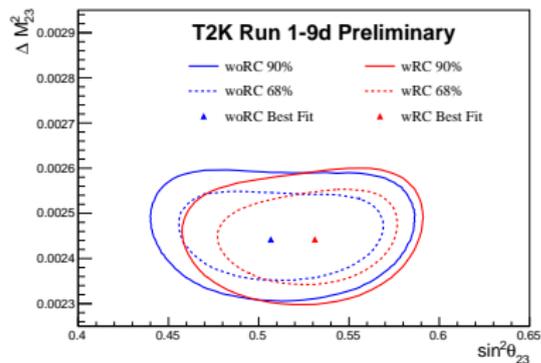

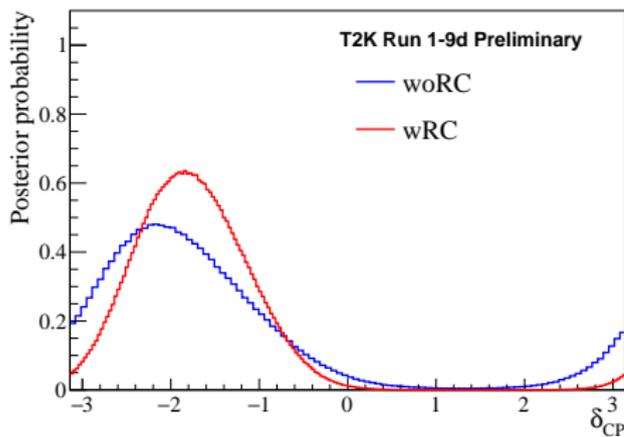

- Free  $\beta$  fit probes non-PMNS space
- $\beta = 1$  fit probes PMNS-only space
- Data consistent with the PMNS model

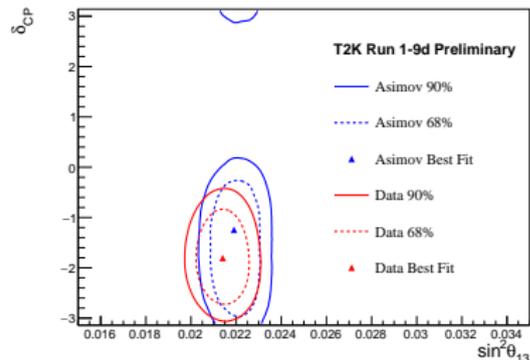

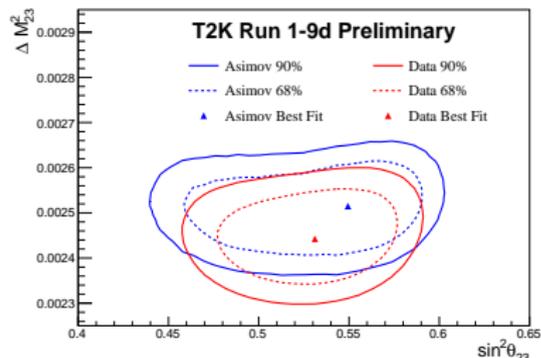

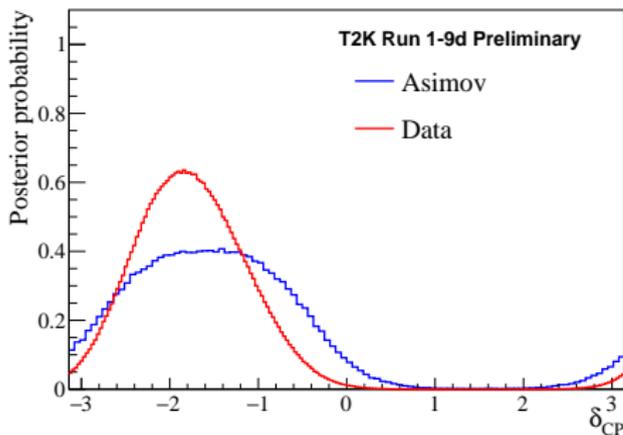

# With/without $\theta_{13}$ reactor

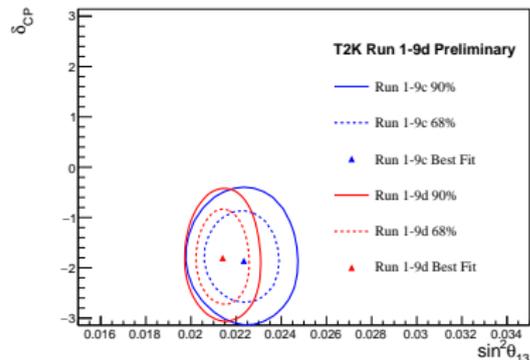

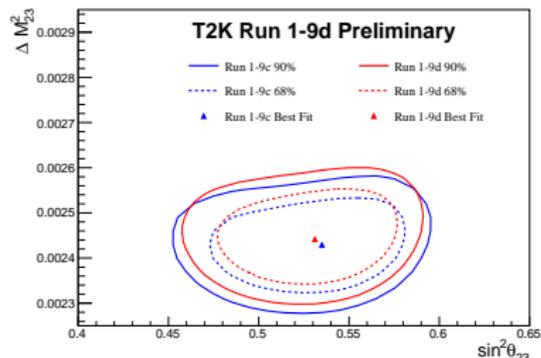

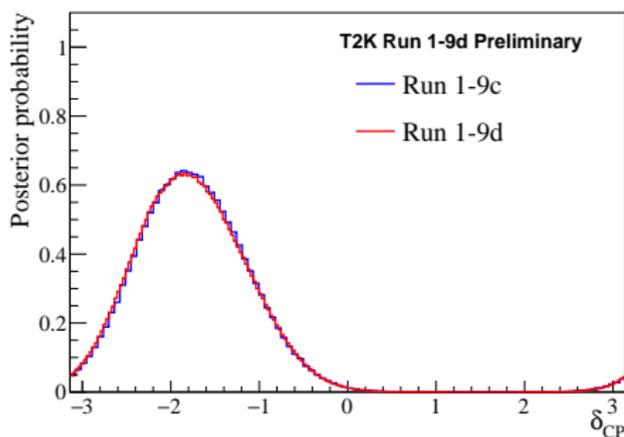

- Normal Hierarchy only
- Reactor constraint in a form of a prior
- Reactor  $\theta_{13}$  taken from 2018 PDG

# Data vs “Asimov” sensitivity

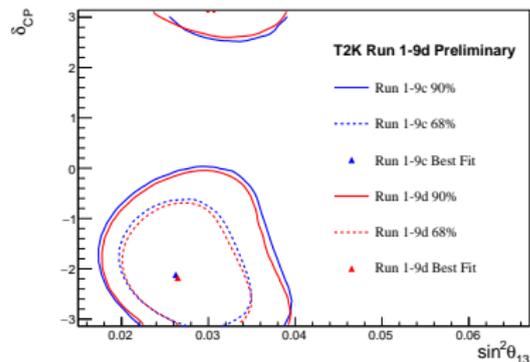

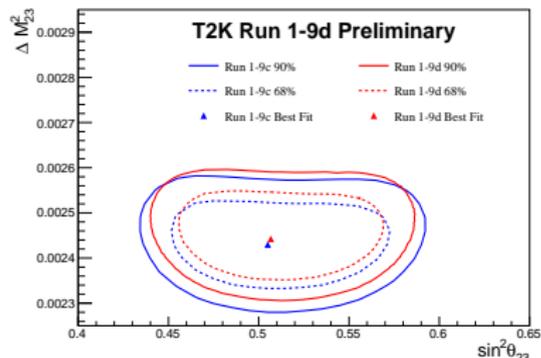

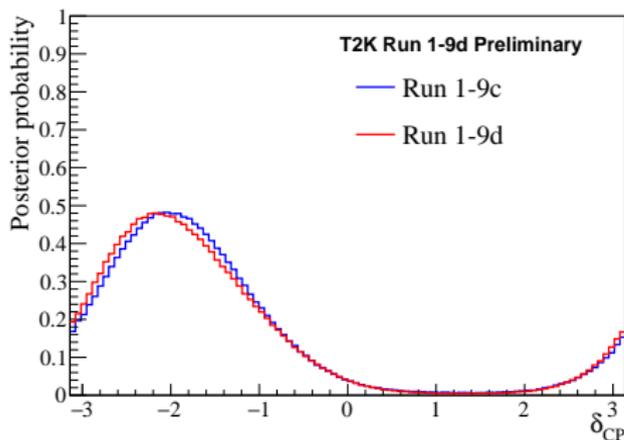

- Normal Hierarchy only
- Higher constraint on  $\delta_{CP}$  than expected from the sensitivity

# New vs old results

- Normal Hierarchy only
- With reactor  $\theta_{13}$
- The reactor  $\theta_{13}$  updated in new fit

# New vs old results

- Normal Hierarchy only
- Without reactor  $\theta_{13}$
